ABSTRACT
Background: Abies webbiana commonly known as Talispatra in Bengali and Hindi, Talispatram in Sanskrit and Indian Silver Fir in English. This is a large, tall, evergreen tree occurring in the Himalayan region from Kashmir to Assam in India. It comes under the Family: Pinaceae. The present study was designed for isolation of flavonoid from ethyl acetate extract of A. webbiana leaves and assessed their toxic effect on liver and kidney.

Materials and Methods: The isolation of flavonoid using different chromatographic methods (thick layer and column chromatography). The isolated flavonoid was identified; Structures and chemical bonds were analyzed by using MP, FTIR, 1-H NMR and MS spectral analysis. Effect of flavonoid on liver and kidney was assessed by inducing (0.1 ml/kg) CCl4 (i.p.) and (6 mg/kg) Cisplatin (i.p.) respectively measured by biochemical marker of liver and kidney.

Results and Discussion: It was identified that isolated compound was 4’-hydroxy quercetin on the basis of FTIR, 1-H NMR and MS spectral analysis. Isolated flavonoid reduced the increased biochemical marker (BM) of liver and kidney. The BM was increased by inducing CCl4 and Cisplatin respectively. Conclusion: Isolated compound was 4’-methoxy quercetin and significantly protect the liver and kidney.

Keywords: Abies webbiana, Quercetin, 1-H NMR, Cisplatin, CCl4.

INTRODUCTION
Abies webbiana commonly known as Talispatra in Bengali and Hindi, Talispatram in Sanskrit and Indian Silver Fir in English, is a large, tall, evergreen tree occurring in the Himalayan region from Kashmir to Assam in India. It comes under the Family: Pinaceae.1 The leaves of this plant have different uses in Ayurveda,2 the traditional system of Indian medicine and have been described for using against swasa, kasa, amadosha, hikka, chihardi and mukharoga.3 A. webbiana leaves have been reported as antibacterial and antifungal, mast cell stabilizing, anti-tumor, anti-inflammatory, anti-tussive, female antifertility, febrifuge, anti-spasmodic properties, Central nervous system (CNS) depressant actions and are effective against hyperglycemia, conception, rheumatism and high temperature.4,5

In phytochemical screening certain chemical constituents, mainly monoterpenes (from essential oil), flavonoids, biflavonoid glycosides, phytosterols, amino acids, saponins, tannins, alkaloids, lipids, triterpenoids, steroids and glycosides were found and a new alkaloid namely 1-(4’-methoxyxphenyl)-aziridine, a nitrogenous compound and a new biflavonoid, Abiesin have been isolated.6,7 The present study focuses on the isolation and assess effect on liver and kidney of flavonoid from ethyl acetate extract of A. webbiana. 4’-methoxy quercetin have been isolated from A. webbiana. Their structures have been elucidated through UV, FTIR, MS and 1-H NMR.

MATERIALS AND METHODS
Collection of plant material
The leaves of A. webbiana were collected from the forest of Tungnath (Garhwal, Uttarakhand). Plant material was authenticated by Head, Department of Pharmacognosy and Ethno-Pharmacology, NBRI, Lucknow. The voucher specimen was preserved for the future reference. The leaves were separated from the branches and dried at the temp of 40°C for one hour before pulverization by mechanically grinder. The powder was passed through 40 mesh sieve and preserved for future purpose in tightly sealed container.

Extraction
800 gm of dried, coarsely powdered of leaves of A. webbiana was extracted with 99% ethanol using soxhlet apparatus. The extract was filtered and the solvent recovered by distillation. The filtered extract was evaporated under vacuum to give semisolid mass (20% w/w) which further dried. Alcoholic extract was suspended in small portion of water, extracted with ethyl acetate and then resulting solution were concentrated to provide ethyl acetate soluble parts. TLC finger prints and phytochemical tests were performed.

Isolation of flavonoid
Ethyl acetate extract was loaded on silica gel (60-120 mesh) column chromatography for the isolation of phytoconstituent gave the various fractions, out of these five fraction no (16-20) from column chromatography were collected. These fractions have the same Rf value when TLC was performed. Fractions were combined based on TLC analysis (developed in Toluene Ethyl acetate Formic acid (6:2:0.8). detected by ferric chloride solution and performed for flavonoid test (Alkaline test, Shinoda test and ZN-HCl). Concentrated fraction kept in refrigerator overnight for crystallization and melting point was measured.

Experimental
UV spectrum was measured with UV/Visible spectrophotometer (UV-1800 Shimadzu, Japan) in CH3OH at room temperature. TLC was performed on a 0.25 mm thick Silica gel G (CDH, New Delhi). The TLC was detected by their UV fluorescence and by spraying with 0.5% FeCl3. Column chromatography was performed with Silica gel 60-120 mesh (CDH, New Delhi). Melting points were determined on open capillaries using a Cintex melting point apparatus. IR Spectra were recorded on Perkin-Elmer spectrum BX series FTIR spectrometer. 1H-NMR spectrum was recorded on Bruker 500 MHz spectrometers using TMS as internal standard. The chemical shifts are reported in ppm (δ) and coupling constants (J) in Hz. Mass spectra was recorded on Bruker 75 MHz spectrometer.
Identification of flavonoid: 4’-methoxy quercetin

Yellow coloured solid compound was obtained and having m.p. 304°C, Rf value (Toluene Ethyl acetate Formic acid, 6:2:0.8) at 0.38. UV–Vis λmax in Ethanol: (nm) 359, IR (KBr), m=862 (C–H, Ar), 1091 (C=O), 1129(–C–C–), 1165, 1259(–O– stretching) 1356, 1454 (C=O), 1515 (C=C, Ar), 1678, 1645 (–C=C stretching) and 3416, 3360, 3251 (Ar-OH). 1HNMR(DMSO-d6), δ=6 7.6(1 H, d, J=1.8 Hz H-2’), 7.54 (1 H, dd, J=1.8, 8.4 Hz H-6’), 6.88(1 H, d, J=8.4 Hz H-5’),6.4(1 H, d, J=1.6 Hz H-8), 6.18(1 H, d, J=1.6 Hz H-6),3.33(3 H, brs, Ome), 4’-methoxy quercetin.

Activity of flavonoid on Liver and Kidney

Animals

Albino rats (Wistar) weighing 150-200 g of either sex were used in the present study. The animals were acclimatized for one week under laboratory conditions in SGIT, Ghaziabad (U.P.). They were housed in polypropylene cages and maintained at 22°C ± 2°C under 12 hrs dark/ light cycle. They were fed with standard rat feed and water ad libitum. The experimental protocol was approved by the Institutional animals ethical committee (IAEC, Registration No SGIT/2014/04) prior to the beginning of the work.

Acute toxicity study

Flavonoid doses (0.5, 5, 300, 500 mg/kg, p.o.) were used for acute toxicity in accordance Organization for Economic Cooperation Development (OECD, 2002) guideline 423. Three rats, each sequentially dosed at intervals of 48 hrs, were used for the test. Once daily cage side observations included changes in skin, fur, eyes, mucous membrane (nasal), autonomic (salivation, lacrimation, perspiration, piloerection, urinary incontinence and defecation) and central nervous system (drowsiness, gait, tremors and convulsions) changes. Mortality, if any, was determined over a period of 2 weeks and dose was taken for isolated flavonoid (50 mg/kg, p.o.).

Method for Evaluation of Hepatotoxicity activity

In the dose response experiment, Wistar albino rats were taken randomly assigned into 3 groups of 6 individuals each. Group-I (-ve control) were administered 1 ml distill water p.o., Group-II (+ve control) were administered (0.1 ml/kg) CCl4 (i.p.) and Group-III were administered (CCl4 50 mg/kg) isolated flavonoid p.o., for 5 days. Animals were sacrificed on the 6th day under mild ether anesthesia. Blood samples were collected for evaluating the serum biochemical parameters such as Serum glutamate pyruvate transaminase (SGPT), Serum glutamate oxaloacetate transaminase (SGOT), Serum alkaline phosphates (SALP), Serum total bilirubin and Serum direct bilirubin were estimated by commercially available kits.

Method for Evaluation of Nephrotoxicity activity

In the dose response experiment, albino rats were taken randomly assigned into three groups of 6 individuals each. Group-I (-ve control) were administered 1 ml distill water p.o., Group-II (+ve control) were administered (6 mg/kg, i.p.) Cisplatin and Group-III Animals were administered (Cisplatin+50 mg/kg) isolated flavonoid p.o., for 7 days. The body weight of all the animals was taken on every day. The animals were sacrificed on day 7 under mild ether anesthesia. Kidney blood samples were collected and kidneys were weighed. The blood samples were used to measure serum creatinine and Blood urea nitrogen (BUN).

Statistical Analysis

The values were expressed as Mean ± SEM. Statistical analysis was performed by tukey multiple comparison test One way analysis of variance (ANOVA) by Tukey multiple comparison test, was carried out and p<0.05 was considered as significant P<0.01 represent more significant and **P<0.001 represent highly significant. Groups were compared with positive control and negative control group.

RESULTS AND DISCUSSION

Yellow coloured solid compound which was having sharp melting point m.p. 304°C that revealed its purity and in TLC single spot with value at Rf=0.38 was obtained. UV λmax in Ethanol: (nm) was obtained 359 nm, IR (KBr), m=862 (C–H, Ar) showed aromatic carbon stretching, 1091 (C=O) showed presence of carbon oxygen, 1129(–C–C–) carbon stretching, 1165, 1259(–O– stretching) 1356, 1454 (C=O), 1515 (C=C, Ar), 1678, 1645 (–C=C stretching) and 3416, 3360, 3251 and was showing presence of hydroxyl aromatic (Ar-OH) (Figure 1).1-HNMR (DMSO-d6) (Figure 2) spectrum the presence of the H-2’ was provided by the presence of one signal doublet at δ 7.67 ppm J=1.8 Hz representing, signal as doublet at δ 7.54 ppm J=1.8 Hz representing H-6’, presence of H-5’ was provided by one signal doublet at δ 6.88 ppm J=8.4, presence of H-8 was provided by the presence of one signal doublet at δ 6.4 ppm J=1.6 Hz representing, presence of H-6 was provided by one signal doublet at δ 6.18 ppm J=1.6 Hz representing and H-3 and methoxy was provided by the presence δ 3.33 ppm. Molecular formula was found by MS C14H12O2(1-2) and 316[M]+ and isolated falvonoid was found as 4’-methoxy quercetin and their structure (Figure 3).34,37 No toxicity effects were found by acute toxicity studies but the higher dose of flavonoid has increased respiration of rats and lower dose was safe. Assessment for activity, one dose level were chosen in such a way that, high dose was approximately one-tenth of the maximum dose during acute toxicity studies, which was (50 mg/kg, p.o.). Preliminary phytochemical investigation of extract led to the presence of alkaloid, flavonoid, terpenoids, tannins, phenolic compound and glycosides. Hepatotoxicity study was performed and level of SGOT, SGPT, SALP and total bilirubin (Total and Direct) was (showed in Table 1). It was found that the biochemical measurement were significant increased as compared to control (Group I) after administration of CCl4 (Group II), Isolated flavonoid (Group III) significantly increased the decreased level of biochemical parameter as compare to negative control (Group II). Nephrotoxicity study was assessed and level of serum BUN, serum creatinine and serum protein % change of body weight shown in (Table 2). The levels of serum BUN, serum creatinine and serum protein and % change of body weights were increased significantly in cisplatin treated animals (Group II) when compared to normal control animals (Group I). The extent of elevation was reduced significantly in animals which received isolated flavonoid (Group III). Exposure of CCl4 has been reported that free radical generated in tissue such as liver heart, brain, blood and testis.39 Free radical of CCl4, believed is process leading to the oxidative stress which is indirect cause the many pathological condition such as diabetes, cancer, liver damage and kidney damage. Most protein found in the plasma are synthesized by the hepatocytes and secreted in circulation. Reduction in total protein level at administration of CCl4.35 Cisplatin significantly elevated the levels of serum BUN, serum creatinine and serum protein; and body weight. Cisplatin induces oxidative stress causing damage to intracellular organelles and alters this functions which lead to inhibition of protein synthesis glutathione depletion lipids peroxidation and mitochondrial damage.29 Flavonoids are a group of polyphenolic compounds which are present widely in plant kingdom both in the free state as glycosides and possess wide biological activities. The capability to interact with protein phosphorylation and the antioxidant iron chelating and free radicals scavenging activity.29,30 A number of flavonoids are known to possess good anti-inflammatory antibacterial, antihepatoxic activity.31 Flavonoids has reported that protective against environmental toxic agents and phytochemical analysis revealed that various chemical constituents like; monoterpenes (from essential oil), flavonoids, biflavonoid glycosides, phytosterols, amino acids, saponins, tannins, alkaloids, lipids, triterpenoids, steroids, diterpene glycosides and alkaloids are present in the leaf of A. webbiana. In the present investigation it was observed that pretreatment

Figure 1: FTIR spectra of flavonoids.
flavonoid (50 mg/kg p.o.) for 5 days has significantly reduced the elevated biochemical markers of liver and kidney.

CONCLUSION
It may be concluded that flavonoid has isolated successfully from the A. webbiana leaves and on the basis of spectral data; the compounds were identified as 4’-methoxy quercetin. It was found that no toxic effect of flavonoid on liver and kidney, instead of whereas it shows protective effect on liver and kidney strongly.

ACKNOWLEDGEMENT
The authors are grateful to Dr. A.K.S Rawat, Head, Department of Pharmacognosy and Ethno-Pharmacology, NBRI, Lucknow (U.P.) for plant identification and authentication. Authors are also grateful to Mr. Vivek Yadav, Research associate, Jubliant chemsys Ltd, Noida, Ghaziabad for spectroscopical analysis.

CONFLICT OF INTEREST
All authors have no conflict of interest.

**SUMMARY**

- It may be concluded that flavonoid has isolated successfully from the A. webbiana leaves and on the basis of spectral data of Mass, IR and NMR; the compounds were identified as 4’-methoxy quercetin.
- Flavonoid is highly responsible for protection of liver and kidney.
- It was found that no toxic effect of flavonoid on liver and kidney, instead of whereas it shows protective effect on liver and kidney strongly.
